# 7.0 Impacts and Benefits Of Sustainable Integrated Solutions

With the development of integrated watershed planning, multi-benefit and multi-purpose projects have moved to the forefront and have become one of the primary goals of the One Water One Watershed (OWOW) process. The idea of meeting a number of community needs with a multi-benefit project is not new; however, specialization within agencies that deal with water has often moved these project types to the backburner. Past efforts primarily have focused on single purpose projects, and the additional effort required to develop multi-objective solutions has made true multi-benefit projects relatively uncommon. In California, there has been an effort to incentivize collaborative planning through Integrated Regional Watershed Management (IRWM) Planning and associated funding sources.

This reliance on single-purpose projects is not unique to water. An interesting analogy can be drawn with the field of public health. Infectious diseases that plague much of the world can be treated by eliminating the infectious agent or interrupting the transmission of the pathogen. Public health programs traditionally focus on both approaches and use a team of physicians, sanitary engineers, and others professionals to address problems, often with great results. The development of more specialization in public health practice, in many cases, has been correlated with the resurgence of some diseases, such as malaria. Recently, scientists have become concerned that the "Balkanization of Science" has resulted in specialists with narrow training focusing only on a single aspect of a broader problem. Effective solutions often are missed by this approach (Moore, 2008). Similar statements could be made about water management. If water is considered in the broadest sense as a resource that benefits a wide group of interests, including those represented by the ten Pillar groups of the OWOW process, the projects that address as many of those interests as possible should be encouraged.

Some of the earliest multi-benefit water projects were done through a partnership between those interested in flood and groundwater management. Spreading grounds along the front slopes of local mountains have attenuated flood flows and recharged groundwater basins for nearly 100 years. OCWD partnered early with Orange County Flood Control District to provide recharge basins within flood control basins. More recently, Inland Empire Utilities Agency (IEUA) has worked with San Bernardino County Flood Control to modify the operation of the flood control system to maximize recharge opportunities. IRWD has partnered with the Orange County Flood Control District to store recycled water in some flood control basins. All of these projects primarily were facilitated by operational changes rather than the construction of new infrastructure, although in some cases the flood system was upgraded. Operational changes could occur only when both parties understood the needs and assets of the other.

The development of multi-benefit projects will remain challenging and require sustained effort by agencies that manage water. In the watershed alone, there are approximately 100 agencies that manage water in some way. This situation is not unique to this watershed. The Federal government has 12 agencies and eight separate committees all doing water-related work (Udall and Averyt, 2009). Agencies need to prioritize collaborative projects and provide the staff resources to ensure that such projects are developed.

The purpose of integrated watershed planning is to consider other disciplines or functional areas when planning and implementing projects. Benefits of this approach far exceed the immediate benefit of reducing controversy surrounding a particular project. The Pillars developed a list of potential benefits in a workshop to identify incentives associated with the development of multi-benefit programs and projects. They are listed below:

Solving Problems using a multi-benefit approach prevents the creation of other problems. Often when a single-function project is developed, it has an impact on other water-related areas, often unanticipated. The truth of this statement is often born out in a CEQA or NEPA analysis, where numerous problem areas can be identified.

Mult-benefit problem solving results in no missed opportunities. In a multi-benefit type of approach, a careful exploration of all aspects of a particular project often results in the identification of incremental project changes that can result in large benefits in other areas.

Cost and resource savings for the public can be achieved. When a multi-benefit project is developed, the cost of providing each benefit is often less than providing similar benefits to the public using two or more separate projects. As land and other public resources become scarce, these types of projects are more likely to be undertaken and provide more public benefit.

Developing projects that provide multiple benefits develops trust. As groups develop multi-benefit projects, trust is developed among different constituencies, each interested in a different aspect of water. These groups are more likely to work toward similar solutions in the future if they have successfully developed multi-benefit projects.

Multi-benefit projects are focused on building successful projects, not dispute resolutions. Groups focused on problem solving rather than dispute resolution or litigation save public resources and implement solutions to regional problems faster than they would had they disputed each other's single-function project.

**Development of multi-purpose projects can develop better communication.** Through the development of a project, groups that span geography or area of interest develop better communication and trust.

Multi-purpose projects often have diverse sources of funding. As multi-benefit projects are developed, multiple State and Federal funding sources become available providing cost share opportunities, and increasing the probability that a specific project would move forward.

**Development of multi-function projects allows sharing of human resources.** Each agency or constituency interested in developing a project has access to individuals with unique abilities and perspectives. Teams formed from diverse groups often develop unique solutions to problems.

Pillar Co-chairs met several times to develop matrices that demonstrated the potential benefits of multibenefit projects undertaken between Pillar groups. In other words, how would a multi-benefit project conducted by one Pillar group benefit another group? The purpose of this exercise was to encourage the Pillars to begin to focus on how implementing projects to benefit their constituency can be designed to benefit others. Drafts of these matrices were taken to three public workshops held in Orange, Riverside, and San Bernardino Counties. At these sessions, stakeholders were invited to comment on the work of the Pillars, as well as suggest their own benefits. Again, the primary purpose of these workshops was to encourage discussion around the concept of designing projects for more than one purpose. As the Pillar leaders completed their final drafts, they developed a list of project types that would benefit more than one Pillar and were worthy of further consideration and implementation.

Under OWOW 2.0 Plan, as some Pillars were folded into others and new ones arose as compared to the OWOW 1.0 Plan, new tables were developed that catalog the potential impacts and benefits at the region level and inter-region levels. A project that fulfills a particular watershed need can be designed to provide other benefits to several other Pillars and to surrounding regions. Maximizing these benefits provides for better projects and better use of public money.

#### Implementation Benefits of Prop 84 Round 1 and Round 2

Since the development of the OWOW Plan, there have been many multi-beneficial projects proposed and funded for the improvement of communities and water agencies alike. These projects have been financed by Proposition 84 Chapter 2 Round 1, and Proposition 84 Round 2, implementation of these developments has provided both regional and inter-regional benefits. Shown below in **Table 7-1** is a list of all the projects and their associated benefits. These projects were able to target key improvement areas within the watershed such as:

- Water Use Efficiency
- Stormwater Capture Storage
- Groundwater Desalination
- Recycling Reuse
- New Storage
- Non-point Source Reduction
- Salt Removal
- Preservation Restoration
- Reduction of TMDL's and other Pollutants

Also part of Round 2, another sequence of proposed and funded projects proved to be multi-beneficial to the watershed. Listed below on **Table 7-2** is a record of all the funded projects and their respective benefits. These follow the same key target improvement areas as shown above. Development and implementation of projects such as these contribute to the overall goal in creating a sustainable watershed.

#### Table 7-1 Implementation Projects Funded by Proposition 84 Chapter 2 Round 1

Project	Benefits
Santa Ana Watershed Vireo Monitoring and Breeding Bird Surveys	Restored 300 acres of endangered bird species habitat
Arlington Desalter Connection Project No. 27 – 1208 & Western Municipal Water District Promenade Connection	• Water use efficiency increase of 11,200 AFY
Groundwater Replenishment System – Flow Equalizer	<ul> <li>Recycling reuse increase of 12,000 AFY</li> <li></li></ul>
Perris II Desalination Facility	<ul> <li>Groundwater desalination of 6,050 AFY</li> <li>Non-point source reduction of 7 MGD</li> <li>21,000 tons of salt removed</li> <li>Two acres of preservation restored</li> </ul>
Cactus Basins No. 3 and No. 3A	<ul> <li>Stormwater capture storage increase of 15,000 AFY</li> <li>700 acres of preservation restored</li> </ul>
Sludge Dewatering, Odor Control, and Preliminary Sludge Thickness at Plant No. 1, Project No. P1 – 101	Recycling reuse increase of 78,400 AFY
Perchlorate Wellhead Treatment System Pipelines	101 tons of salt removed
Chino Creek Well-field, Wells 1,2, and 3	<ul><li>Groundwater desalination of 2,900 AFY</li><li>One ton of salt removed</li></ul>
Cucamonga Creek Watershed Regional Water Quality Project (Mill Creek Wetlands)	<ul> <li>New storage of 160 AF</li> <li>14 acres of preservation restored</li> </ul>
Repairs to the Unlined RCP Reach IVA and Reach IV-B Santa Ana Regional Interceptor (SARI)	Supports continued brine disposal
Well 21 and 22 Project	Groundwater desalination of 6,300 AFY
Alamitos Barrier Improvement Project	520 tons of salt removed
Arlington Basin Water Quality Improvement Project	<ul> <li>Stormwater capture storage increase of 1,300 AFY</li> <li>16 acres of preservation restored</li> </ul>

# Table 7-2 Implementation Projects funded by Proposition 84 Chapter 2 Round 2

Project	Benefits
Wineville Regional Recycled Water Pipeline and Groundwater Recharge Systems Upgrades	<ul> <li>Stormwater capture storage increase of 4,600 AFY</li> <li>46 acres of preservation restored</li> </ul>

Forest First – Increase Stormwater Capture and Decrease Sediment Loading through Forest Ecological Restoration	<ul> <li>1,750 acres of preservation restored</li> </ul>
Perris Desalination Program – Brackish Water Wells 94, 95 and 96	<ul> <li>Groundwater desalination of 2,900 AFY</li> <li>4,060 tons of salt removed</li> </ul>
San Sevaine Ground Water Recharge Basin	<ul> <li>Stormwater capture storage increase of 2,000 AFY</li> <li>26 acres of preservation restored</li> </ul>
Vulcan Pit Flood Control and Aquifer Recharge Project	<ul> <li>Stormwater capture storage increase of 2,000 AFY</li> <li>60 acres of preservation restored</li> </ul>
Wilson III Basins Project and Wilson Basins/Spreading Grounds	<ul> <li>Stormwater capture storage increase of 1,300 AFY</li> </ul>
Peters Canyon Channel Water Capture and Reuse Pipeline	Reduction of TMDL and other pollutants
Corona/Home Gardens Well Rehabilitation and Multi-Jurisdictional Water Transmission Line Project	Restoration of water service
Commercial/Industrial/Institutional Performance-Based Water Use Efficiency Program	Water use efficiency increase of 400 AFY
Quail Valley Subarea 9 Phase 1 Sewer System Project	Septic tank to sewer conversion
Francis Street Storm Drain and Ely Basin Flood Control and Aquifer Recharge Project	• Stormwater capture storage increase of 622 AFY
Customer Handbook to Using Water Efficiently in the Landscape	Water use efficiency increase of 7,240 AFY
Plunge Creek Water Recharge and Habitat Improvement	<ul> <li>Stormwater capture storage increase of 1,250 AFY</li> <li>50 acres of preservation restored</li> </ul>
Prado Basin Sediment Management Demonstration Project	• Stormwater capture storage increase of 450 AFY
Enhanced Stormwater Capture and Recharge along the Santa Ana River	• Stormwater capture storage increase of 14,600 AFY
14th Street Groundwater Recharge and Storm Water Quality Treatment Integration Facility	• Stormwater capture storage increase of 400 AFY
Soboba Band of Luiseño Indians Wastewater Project	Feasibility Study
Canyon Lake Hybrid Treatment Process	<ul> <li>525 acres of preservation restored</li> <li>50% reduction in total Phosphorus concentration</li> </ul>
Recycled Water Project Phase I (Arlington-Central Avenue Pipeline)	Recycling reuse increase of 6,000 AFY
Regional Residential Landscape Retrofit Program	Water use efficiency increase of 1,000 AFY

#### Table 7-12 Impacts and Benefits of Energy and Environmental Impact Response

# Conclusion

Implementation of these projects found in the OWOW 2.0 Plan proves to be critical in creating a sustainable watershed. We must understand that the development of ideas and methods not only have a direct impact within the region, but also inter-regionally. The information above is a list of potential impacts and benefits relatable to the Pillars found in the OWOW 2.0 Plan. These benefits and impacts are separated into two different categories that give a brief analysis of the strategic implementation. It is important that these potential impacts are realized so that if they do occur, the watershed is prepared. Also it is important to see the potential benefits these outcomes could have on the region and inter-regions. The development and implementation of multi-benefit projects will remain challenging and require sustained effort by agencies that manage water.
